

Tricks in R

Some clean up work using tidyverse

```
suppressWarnings(suppressMessages(library(tidyverse)))
library(tidyverse)

wage.df = read.csv("/Users/shahrdadshadab/env/my-R-project/ISLR/Data/datasets/Wage.csv",
                  header=T, stringsAsFactors = F, na.strings = "?")
wage.df.original = tibble(wage.df)
wage.df = tibble(wage.df)

# converts maritl into an ordered factor
# find levels in maritl column
table(wage.df$maritl)[["1. Never Married"]]

## [1] 648

marit_levels <- names(table(wage.df$maritl))
typeof(marit_levels)

## [1] "character"

# now convert it to order factor

# iris %>% select(starts_with(c("Petal", "Sepal")))

# iris %>%
#   group_by(Species) %>%
#   summarise(across(starts_with("Sepal"), mean))

# iris %>% summarise_at("Petal.Width", funs(min, anyNA))
# starwars %>% mutate_if(is.numeric, scale2, na.rm = TRUE)

wage.df %>%
  mutate_at("maritl", ~factor(.x, levels=(.x %>% table() %>% dimnames())))

## # A tibble: 3,000 x 12
##   year   age sex maritl race  education region jobclass health health_ins

## # ... with 2,990 more rows, and 2 more variables: logwage <dbl>, wage <dbl>
```

table and factor

```
# ----- table is used for counting records on one or more factor columns -----
(x <- table(mtcars[c("vs", "cyl", "am")]))

## , , am = 0
##
##   cyl
## vs  4  6  8
##   0  0  0 12
##   1  3  4  0
##
## , , am = 1
##
##   cyl
## vs  4  6  8
##   0  1  3  2
##   1  7  0  0

# ---- for classification use ordered factor to assign 1 to quality of interest ----#
x<-factor(c("a","b","b","a"))
y<- ordered(c("a","b","b","a"), levels = c("c","b","a"))
str(attributes(y))

## List of 2
## $ levels: chr [1:3] "c" "b" "a"
## $ class : chr [1:2] "ordered" "factor"

# ----- modify levels of a factor -----

x <- ordered(c("a", "b", "a", "b"), levels = c("a", "b", "c"))
```

```
table(x)

## x
## a b c
## 2 2 0

levels(x) <- rev(levels(x))
table(x)

## x
## c b a
## 2 2 0
```

Modify in place

- Modifying an R object usually creates a new copy.
 - Use `base::tracemem(x)` to see if the object is copied

```
#-----
# object with a single binding (object has a single name bound to it)
#-----

(v <- c(1,1,1))

## [1] 1 1 1
# use base::tracemem(x) to see if the object is copied
cat(tracemem(v), "\n") # start tracing reference to v

## <0x7fb3e898e518>

v[[3]] <- 4

## tracemem[0x7fb3e898e518 -> 0x7fb3e560a328]: eval eval withVisible withCallingHandlers handle timing_
v

## [1] 1 1 4
untracemem(v) # stop tracing reference to v
```

Atomic Vector Subsettings and Factor Subsettings

- Key Points:
 - avoid using: `is.atomic()`, `is.numeric()` and `is.vector()`, use `is.null(dim())`
 - applying `typeof()` to a vector returns type of its elements
 - use `[]` to retrieve multiple values from a vector
 - * using `[[]]` to get multiple values from a vector causes Error
 - recommended to use `[[]]` to retrieve a single element from a vector
 - * `[[]]` with zero length, NULL and out of bound index or name return error:
 - `vector[NULL] ==> Error`
 - `vector[integer(0)] ==> Error`
 - `vector[out_of_bound_integer] ==> Error`
 - `vector[out_of_bound_character] ==> Error`
 - * `[]` with zero length, NULL and out of bound index or name return empty vector
 - only logical vector is recycled when used for subsetting

- NA has logical type thus when used for subsetting it will be recycled
- coercion used by `c()` is: *logical => integer => double => character*
- avoid automatic coercion inside `c()`, always do explicit coercion within `c()`
- To create an empty vector of certain “type” and certain “length”
 - * `vector(“type”, length = n)` as: `vector(“complex”, length = 0)`
 - * `type(n)` as: `numeric(3)`
 - * `type()` is shorthand for `type(0)` as: `numeric()`

```
#-----
# --- This is how R show an unnamed vector ---
#-----
```

```
(x <- c(2.1, 4.2, 5.3, 1.4))
```

```
## [1] 2.1 4.2 5.3 1.4
```

```

## [1] a
## Levels: c < b < a
```

List Subsettings

- Key Pints:
 - *typeof()* applied on a list returns *list*
 - `[]` operator always returns a list whereas `[[]]` operator returns a single object
 - `$col` is a short form for `[["col"]]` returns a single object bound to “col”
 - `$col` is translated to `[["col"]]` by R
 - `[[]]` better be used with single positive integer or single string
 - Subsetting a non_empty list with `[[]]` returns:
 - * `list[[NULL]] ==> Error`
 - * `list[[integer(0)]] ==> Error`
 - * `list[[out_of_bound_integer]] ==> NULL`
 - * `list[[out_of_bound_character]] ==> NULL`
 - NULL is an empty list
 - Subsetting NULL always returns NULL
 - * `NULL[[NULL]] ==> NULL`
 - * `NULL[[integer(0)]] ==> NULL`
 - * `NULL[[out_of_bound integer]] ==> NULL`
 - * `NULL[[out_of_bound character]] ==> NULL`
 - * `NULL[NULL] ==> NULL`
 - * `NULL[integer(0)] ==> NULL`
 - * `NULL[out_of_bound_integer] ==> NULL`
 - * `NULL[out_of_bound_character] ==> NULL`
 - `[[c(1,2)]]` is equivalent to `[[1]][[2]]` (use *purrr::pluck(x, 1, 2)* instead)
 - `$` operator does partial matching but `[[]]` operator performs full matching
 - avoid silent partial matching by: `options(warnPartialMatchDollar = T)`
 - To create an empty list: *list()*
 - To create a list of length n full of NULL: *vector("list", length=n)*
 - `NULL == list() == list()[0] == list()[1]`
 - To convert a list to a vector use *unlist* (note *vector(list)* does not work!!)
 - Note that *unlist* strip off attributes of the object in the list
 - `list[NA]` returns NA

```

Matrix Subsettings

- Key Pints:
 - *matrix* is just an atomic vector with three attributes:
 - * dimensions
 - * row names
 - * column names
 - Subset a *matrix* by supplying a vector of indices for each dimension:
 - * All rules for subsetting a vector is applied to subsetting each dimension
 - vector of values is used to fill a *matrix* up column by column or row by row
 - Dimension Dropping:
 - * `[]` simplifies result to lowest possible dimensionality unless we set `drop=F`
 - * `matrix[row #i,]` returns row #i as a vector
 - * `matrix[, col# j]` returns col #j as a vector
 - * To preserve dimensionality set `drop=F` as last argument of operator `[[]]`
 - Subsetting a *matrix* with a single vector

- * *matrix* is a vector so like vectors we can use vector of indices to subset it
- * Index of the elements in the *matrix* always goes column by column
- Subsetting *matrix* with logical *matrix* which has same dimension as the original one
- * R selects those elements that correspond to TRUE in logical matrix

```
(a <- matrix(1:9, nrow = 3, byrow = F))
```

```

Dataframe Subsettings as List of Lists and as Matrix

- Key Points:
 - Dataframe treated as a list of lists:
 - * When subsetting with a single index or vector of indices it behaves like a list of columns (i.e list of lists)
 - * All rules for list subsetting using `[]` and `[[]]` are applied
 - * Single index `[]` returns a dataframe (i.e a list, remember list subsetting rules)

- * Single index `[[]]` returns vector (i.e an object , remember list subsetting rules)
- Dataframe treated as a *matrix*
 - * Two sets of indices are used to subset a dataframe which returns a dataframe
 - * Filter condition is always filter rows ,it is only on first index
 - * dataframe with single column returns only that column unless we use `drop=F` (remember dimension dropping)

```

# reduce / reduce_right is R's foldleft / foldRight

# ----- foldLeft(List[Int])(acc, x => acc :+ (x + 1)) -----
# Note #1: The First argument of the function is always zero of monoid.
# you can set zero of monoid using ".init" argument of reduce.
# If .init is not provided then first element of the list is used as zero.
# Note '.init = NULL' forces reduce to use NULL (i.e. an empty list) as
# zero of the monoid and pass it as the first argument to the provided function
# rather than using .x[[1]].
# reduce passes elements of the collection as function's second argument.
```

## # ... with 327,336 more rows, and 11 more variables: arr_delay <dbl>,
## #   carrier <chr>, flight <int>, tailnum <chr>, origin <chr>, dest <chr>,
## #   air_time <dbl>, distance <dbl>, hour <dbl>, minute <dbl>, time_hour <dtm>

# let's look at the planes (identified by their tail number) that have the highest average delays:

delays <- not_cancelled %>%
  group_by(tailnum) %>%
  summarise(delay = mean(arr_delay))

ggplot(data = delays, mapping = aes(x = delay)) +
  geom_freqpoly(binwidth = 10)

```

Wow, there are some planes that have an average delay of 5 hours (300 minutes)!
Let's draw a scatterplot of number of flights vs. average delay:

```
(delays1 <- not_cancelled %>%
  group_by(tailnum) %>%
  summarise(count = n(), delay = mean(arr_delay))
)
```

```
## # A tibble: 4,037 x 3
##   tailnum count  delay
##   <chr>   <int> <dbl>
## 1 D942DN     4  31.5
## 2 NOEGMQ   352   9.98
## 3 N10156   145  12.7
## 4 N102UW    48   2.94
## 5 N103US    46  -6.93
## 6 N104UW    46   1.80
## 7 N10575   269  20.7
## 8 N105UW    45  -0.267
## 9 N107US    41  -5.73
## 10 N108UW    60  -1.25
## # ... with 4,027 more rows
```

```
# filter(delays1 , is.na(delay) | is.na(count))
```

```
delays1 %>%
```

it's often useful to filter out the groups with the smallest numbers of observations to see pattern.

```
filter (count > 50) %>%
```

```
ggplot(mapping = aes(x=count, y=delay))+
```

```
geom_point(alpha=1/10)
```

ANOTHER EXAMPLE:

When I plot the skill of the batter (measured by the batting average, ba) against the number of opportunities (measured by at bat, ab), you see two patterns:

```
batting <- as_tibble(Lahman::Batting)
(batters <- batting %>%
  group_by(playerID) %>%
  summarise(ba = sum(H, na.rm = T)/sum(AB, na.rm = T), ab = sum(AB, na.rm = T))
)
```

```
## # A tibble: 19,428 x 3
##   playerID      ba    ab
##   <chr>      <dbl> <int>
## 1 aardsda01  0         4
## 2 aaronha01  0.305   12364

## 4 aasedo01   0         5
## 5 abadan01   0.0952     21
## 6 abadfe01   0.111      9
## 7 abadijo01  0.224     49
## 8 abbated01  0.254   3044
## 9 abbeybe01  0.169    225
## 10 abbeych01 0.281   1756
## # ... with 19,418 more rows
```

```
# Variation in our aggregate decreases as we get more data points.
# There's a positive correlation between skill (ba) and opportunities to hit the ball (ab).
```

```
batters %>%
  filter (ab > 100) %>%
  ggplot(mapping = aes(x=ab, y = ba)) +
  geom_point()+
  geom_smooth(se=F)
```

```
## `geom_smooth()` using method = 'gam' and formula 'y ~ s(x, bs = "cs")'
```

```
# If you naively sort on desc(ba), the people with the best batting averages are clearly lucky, not ski
```

```
batters %>%
  arrange(desc(ba))
```

```

```

Be careful when progressively rolling up summaries: it's OK for sums and counts, but you need to think about medians.
I.e. the sum of groupwise sums is the overall sum, but the median of groupwise medians is not the overall median.

If you need to remove grouping, and return to operations on ungrouped data, use ungroup()
daily <- group_by(flights, year, month, day)

```
daily %>%
  ungroup() %>% # no longer grouped by year-month-day
  summarise(flights = n())
```

```
## # A tibble: 1 x 1
##   flights
##   <int>
## 1  336776
```

```
library(nycflights13)
library(tidyverse)
```

```
not_cancelled <- flights %>%
  filter(!is.na(arr_delay) & (!is.na(dep_delay)))
# 1)
# A flight is 15 minutes early 50% of the time, and 15 minutes late 50% of the time.
(not_cancelled %>%
  group_by(flight) %>%
  summarize(total = n(),
            early15 = sum(arr_delay == -15),
            late15 = sum(arr_delay == 15)) %>%
  filter(total != 0 & early15 != 0 & late15 != 0 & near(total / 2, 0.5))
)
```

```
## # A tibble: 0 x 4
## # ... with 4 variables: flight <int>, total <int>, early15 <int>, late15 <int>
```

Another way :

```
(not_cancelled %>%
  group_by(flight) %>%
  summarize(total = n(),
            early15 = mean(arr_delay == -15, na.rm = T),
            late15 = mean(arr_delay == 15, na.rm = T)) %>%
  filter(total != 0 & early15 == 0.5 & late15 == 0.5)
)
```

```
## # A tibble: 0 x 4
## # ... with 4 variables: flight <int>, total <int>, early15 <dbl>, late15 <dbl>
```

A flight is always 10 minutes late.

```
(not_cancelled %>%
  group_by(flight) %>%
  filter(arr_delay == 10)
)
```

```

```

```
# Using the constructed data frame containing the values of the features in the test set as well as the
```

```
# plot estimates vs individual features in the test set
```

```
plots <- list()
for (feature in colnames(carseats.df)) {
  if (feature == "Sales") {
    next
  }
  p <- ggplot(df, aes_string(x = feature,
                             y = "PredictedSalary")) +
    geom_line(colour = "blue") +
    geom_point() +
    geom_ribbon(aes(ymin = Lower, ymax = Upper),
               alpha = 0.5)
  plots[[feature]] <- p
}
library(gridExtra)
grid.arrange(plots[[1]], plots[[2]], plots[[3]])
```

These graphs shows high confedence when predicted salary is between 10 and 30

```
fun1 <- function(teta) {1 + sin(teta)}
p <- ggplot(tibble(teta = 0:2*pi), aes(x = teta)) + stat_function(fun = fun1)
p
```

```
fun2 <- function(teta){cos(2*teta)}  
df <- tibble(teta=0:2*pi)  
ggplot(df, aes(x = teta)) + stat_function(fun = fun2)
```

#----- polar coordinate if you know how to transform polar equation into cartesian-----

```
df <- tibble(r = seq(0, 2, length = 50), teta = seq(0, 2*pi, length = 50))
transformed <- transform(df,
  x = r * sin(teta),
  y = r * cos(teta)
)

ggplot(transformed, aes(x, y)) +
  geom_path() +
  geom_point(size = 2, colour = "red") +
  coord_fixed()
```
